

Stop guessing. Start fixing...

your SQL performance bottlenecks.

— ENVIRONMENT OVERVIEW

ROK Quarry automatically scans your SQL Servers, grading findings by severity and delivering a prioritized, executive-ready dashboard. We do the monitoring and the interpretation; **you get a clear, actionable fix list.** Stop spending countless hours chasing outages and performance issues and finally master your SQL health, without the manual work.

Real-time monitoring

Every SQL Server watched continuously — no manual work, no one logging in to run scripts.

A fix attached to every problem

Each finding includes a plain-language description and a specific recommendation — what to do, not just what's wrong.

Severity grading on every finding

Critical to Info, using real thresholds — a prioritized list, not a wall of raw metrics.

Tracks issues over time

When a problem clears, Quarry resolves it automatically and keeps the history — what got fixed, what keeps coming back.
